Indian Job Market Intelligence & Skill Gap Analysis

1. Project Objective

The objective of this project is to analyze Indian job postings to understand popular job titles, hiring locations, in-demand data-related skills, and salary patterns.

2. Tools Used

- Python
- Pandas
- Matplotlib
- Google Colab

3. Key Findings

- Application Developer was the most common job title in the dataset, with 2,033 postings.
- Bengaluru had the highest number of overall job postings, with 16,783.
- Python was the most-mentioned skill in data-related job postings, with 1,509 mentions.
- SQL was the second most-mentioned skill, with 1,220 mentions.
- Bengaluru led the data-related job subset with 1,578 postings, followed by Hyderabad with 790.

4. Business Insights

The results show that Bengaluru is an important location in this dataset for both overall and data-related job opportunities. Python and SQL are prominent skills in the selected data-related postings.

5. Recommendations

Aspiring data analysts can focus on Python, SQL, data analysis, and business problem-solving. They should also review job descriptions to understand the specific tools and skills employers require.

6. Conclusion

This project uses data analysis and visualization to explore job market patterns in India. The findings can help job seekers understand skill demand and identify locations with more relevant job postings.
